

1. unzip(betterzip or archive utility, which is what i used)
2. it should unzip two files, and copy both to your desktop. one is ableton the program the other is the patch zip
3. install ableton to your desktop
4. unzip the patch file
5. go into your system settings, safety/privacy settings(the one with the lock), and permit programs from any origin
6. now we can open ableton and see everything in the program and stuff. if you can't open it, you can try using the thing, the thing in the original folder that has chinese characters in the name. in THAT program, make sure that everything has a checkmark. i didn't have to do this step tho btw
7. after u confirm that u can open it, close ableton and move it from your desktop to the applications folders, now we start to do the cracking steps. there are two files in the crack zip. open the patch command in terminal and enter your system password. if you don't have a password, set one. when you enter a password in terminal you can't see the progress btw. but just write your password and press enter trust me just do it ughghhhghghghg
8. it should say 'live is ready to authorize using the key file
9. open the authorize.aux file, double click on it and you'll see that it opens live
10. it should say that you successfully authorized live`
